APPENDIX 11.B: REVIEW OF CALCULATION OF RAILWAY NOISE

The noise predictions have been carried out using a noise prediction template implementing calculation routines based on the Calculation of Railway Noise (CRN) procedure. The source noise levels were based on measurements taken on equivalent sections of existing Luas lines as detailed in Section 11.2.7.

In general, the tram noise level is calculated taking into account a range of factors affecting the propagation of sound, including:

- the magnitude of the noise source;
- the distance between the source and receiver;
- the presence of obstacles such as screens or barriers in the propagation path;
- the presence of reflecting surfaces;
- the hardness of the ground between the source and receiver.

The CRN method of predicting noise from a rail scheme consists of the following five elements:

- divide the track into segments so that the variation of noise within this segment is small;
- calculate the basic noise level at a reference distance of 12.5 metres from the nearside track edge for each segment;
- assess for each segment the noise level at the reception point taking into account distance attenuation and screening of the source line;
- correct the noise level at the reception point to take account of site layout features including reflections from buildings and facades, and the size of source segment;
- combine the contributions from all segments to give the predicted noise level at the receiver location for the entire development.

Note that all calculations are performed to one decimal place. For the purposes of comparison with the design goals, the relevant noise level is rounded to the nearest whole number.

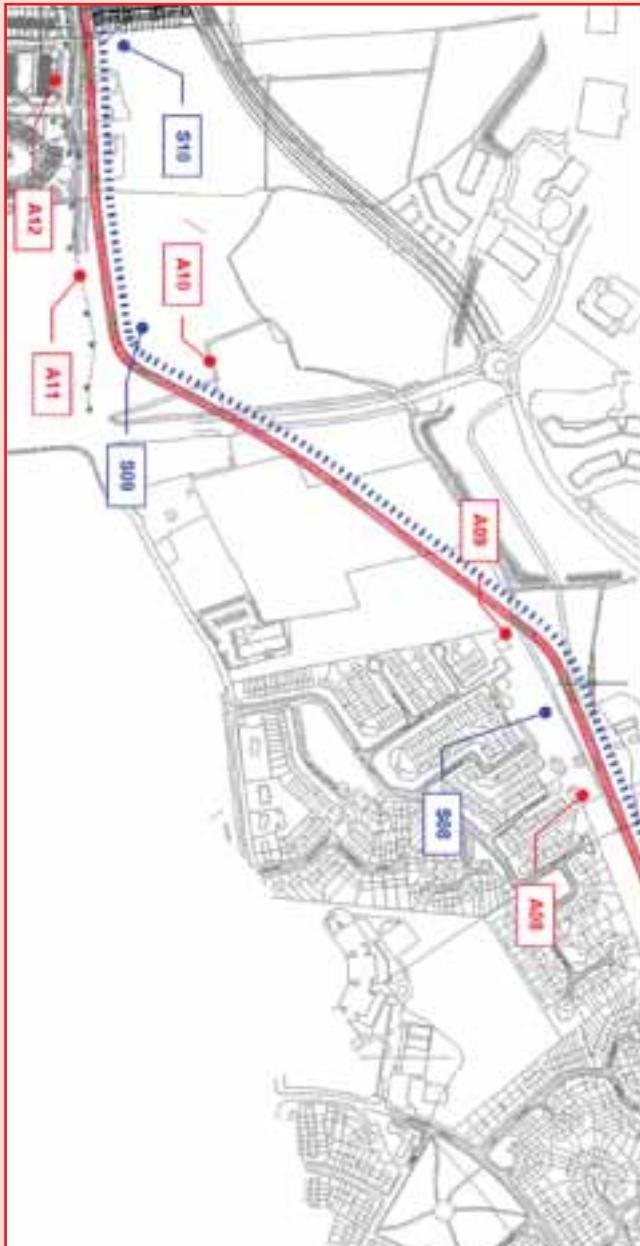

The noise calculations were prepared using the following data:

- development alignments, topographical data (including existing boundary walls and new boundary walls proposed as part of the scheme) and Ordnance Survey mapping supplied by Brian Meehan & Associates;
- timetable data from existing Luas line operations.

APPENDIX 11.D: BASELINE VIBRATION MONITORING RESULTS

Table 11.D.1 Measured Vibration Levels at Location S01

Time	Tran PPV (mm/s)	Tran Freq (Hz)	Vert PPV (mm/s)	Vert Freq (Hz)	Long PPV (mm/s)	Long Freq (Hz)	Geo PVS (mm/s)
20:47:48	0.254	>100	0.254	>100	0.127	>100	0.284
20:48:48	0.254	>100	0.254	>100	0.127	>100	0.311
20:49:48	0.254	>100	0.127	>100	0.127	>100	0.311

Note: A value of 0.127 relates to the lower limit of detection of the vibration meter. A freq of >100 indicates that the maximum frequency is above 100Hz. Typically where these items are noted no significant vibration event has occurred with the period under review.
